#### KIYEV AERODYNAMIC TEST FACILITY, USSR (S)

1. (S) This report provides an initial description of the Kiyev Aerodynamic Test Facility, USSR. It includes a location map, two annotated photographs, and a table of mensural data.	
2. (S) The Kiyev Aerodynamic Test Facility is situated in an area of relatively level terrain along the southeastern shoreline of the Kiyevskoye Reservoir at 50-39-50N 030-31-20E (Figure 1). This facility is 13.2 nautical miles (nm) north-northeast of the center of Kiyev and 3.5 nm northeast of the Kiyev Hydroelectric Power Plant GAES The facility comprises two distinct engineering/test areas covering an area of approximately 60.6 hectares (Figure 2). The northern, western, and southern boundaries of the facility are defined by a combination of walls and fences. The eastern boundary of the facility is defined by the shoreline of the western bank of a canal. There is no evidence of special security measures such as guard towers, light towers, or sentry dog kennels. The facility is road served and could make use of boat or barge traffic on the reservoir or canal.	25X1 25X1
3. (TSR) The northern area of the Kiyev Aerodynamic Test Facility (Figure 2) is the older of the two areas. As of August 1978, the northern area covered approximately 11.8 hectares and contained 27 completed buildings and structures with a total floorspace of approximately 6,716 square meters. At that time, construction north of this area indicated that the northern area may eventually cover as much as 21.8 hectares.	
4. (TSR) The two most prominent features in the northern area are the probable modified linear test track (item 1, Figure 2 and Table 1), which is under construction, and the fixed-turn-radius monorail (item 18). The probable modified linear test track will be approximately 588 meters long when completed and will be supported by evenly spaced concrete supports. These supports are approximately and the spacing between supports is approximately The primary direction of travel for a test item will probably be south to north. Thus, a test item will cover approximately of straight track before entering a slight curve. The distance through the curve is approximately After traversing the curve, the test item will travel another over straight test track before stopping.	25X1 25X1 25X1 25X1 25X1
5. (TSR) The fixed-turn-radius monorail (item 18) has an overall length of with a fixed-radius turn of approximately The western end of the test track is elevated approximately above ground level. At the midpoint of the fixed-radius turn the test track is elevated approximately above ground level. The eastern end of the test track appears to be at ground level. The test track is enclosed by a wire cage, probably of chainlink construction, that is approximately across. The primary direction of travel on this J-shaped track during a test run is probably west to east then north.	25X1 25X1 25X1 25X1 25X1
6. (TSR) Buildings in the northern area of the Kiyev Facility include a C-shaped administration/engineering building (item 2), an assembly/checkout building (item 16), a shop building (item 13), and two shop/maintenance buildings (items 15 and 22). Additional buildings include four shop/storage buildings (items 3 through 6), two vehicle storage buildings (items 8 and 11), a test support building (item 12), four support buildings (items 7, 9, 14, and 20), and a security building (item 21). This area also contains a probable POL storage facility (item 10), two test monitoring stations (items 17 and 19), and several general-purpose support structures.	
7. (TSR) As of August 1978, the southern area of the Kiyev Facility covered approximately 48.8 hectares and contained 20 buildings and structures with a total floorspace of approximately The two most prominent features in this area are the large assembly/check-out building (item 24) and the modified linear test track (item 31). The assembly/checkout building comprises two single-story, high-bay assembly/checkout sections; a two-story engineering/shop section; and a single-story shop/support section. The total amount of floorspace for this building is approximately 2,582 square meters.	25X1
8. (TSR) The modified linear test track (item 31) in the southern area is long overall and approximately wide. The primary direction of travel for a test item on this track would be north to south. The test item would travel approximately of straight track before entering a slight curve. After travelling approximately through the curve, the test item would again encounter a straight section of track and travel approximately before stopping. The test track begins in front of the western assembly/checkout section of the large assembly/checkout building. Parallel ground scars, indicating the presence of rails, extend from the northern end of the test track into the western subassembly/checkout section of the building. Both ends of the test track appear to be elevated slightly above ground level, with the middle of the test track even more elevated.	25X1 25X1 25X1 25X1 25X1
9. (TSR) A possible monorail (item 32) was under construction east of and parallel to the modified linear test track. This probable monorail will be at least 1,128 meters long when com-
